Reflection Report 1

I am currently a junior with a major in computer science. I chose this major because I have always been naturally one with technology. Technology and all of its problems come very easy to me with respects to technology's numerous flaws. I enjoy the problem-solving challenge that comes with programming and the need to think outside of the box. Associated with my degree and my space minor, I am really interested in landing a career that has something to do with space and computer science. Ideally, I would love to work for an aerospace company building and designing programs that help to further space exploration. After graduation, I see myself working for a large company as a programmer, whether it be data analytics or designing software. This summer, I will be interning at a company that builds software for 95% of the Fortune 100 companies so that I can get introduced into industry. My goal for next summer is to intern at Lockheed or Ball Aerospace. I am pursuing a minor in space because I am fascinated the growing expanse of space and all of its mysteries. I see a connection between my major and minor because, whenever there is a desire to send man or machine into space, there is code to be written to fulfill that dream. Regarding Pathway to Space, I love this class. The layout of this class works and keeps my interested and learning more and more every class.
